```
int i=1
cout<<(i==1)->1
cout<<(1==1)->1
```

The rule for identifier names for constants is the same as that for variables. However, by convention, constant identifiers are written in capital letters.

const不分配内存，在编译时就被确定值所以编译器会直接用常量的实际值代替常量名

float<double overflow/underflow

mod is used to get the remainder in an integer division. $\text{mod}(17, 5) = 17 \bmod 5 = 17\%5 = 2$
strictly only for positive

C++ can deal with -ve eg. $-7\%5 = -2$ $7\%-5 = 2$ $-7\%-5 = -2$ $a\%b$ satisfies $r = a - (a/b)*b$
除数符号无影响，余数符号a相同

C++会根据相关变量自动处理对象

$3/4=0$!! 因为3, 4都是int, 默认整数除法
只要有一个是float就能是0.75
